

UTHM INDUSTRIAL VISIT

“

SUMMARY

Our industrial visit held on 3rd December 2025 at the UTHM Digital Gateway. It is a newly constructed building that designed to become the university's upgraded digital infrastructure hub.

During the visit, we were given a chance to step into their new data centre, including its command operations centre and utility rooms. The staff has provided detailed explanations about the layout, cooling systems, containment technologies and security measures implemented before we visit the places.

We also participate in the Q&A session with different major of staff who working at the UTHM Digital Gateway. Through this session, we gained valuable insights and a lot of knowledge.

Overall, the visit allowed us to understand how a modern university data centre operates and how digital infrastructure is maintained.

TECHNOLOGIES AND ISSUES

UTHM's new data centre features hot aisle and cold aisle containment for efficient airflow. The hot aisle channels hot air to cooling units, while cold aisle delivers cold air directly to servers for better temperature control in the server room. The hot aisle section is also prepared for future collaboration with external agencies, while the cold aisle supports UTHM's internal systems. The centre is built to Tier 3 standards, providing redundant power and cooling for higher reliability and reduced downtime. This setup ensures that UTHM can handle growing digital demands more efficiently.

We visited the Command Operations Centre, which displays CCTV and real-time system status. Access to the Unity Room (data centre room) is strictly controlled for installation, removal or maintenance work. The Utility Room manages key configurations such as server placement and IP setup. UTHM has also started implementing IPv6 to prepare for future network expansion and better addressing capacity.

SABRINA HENG WEI QI A23CS

This visit gave me a deeper appreciation of how important digitalization has become for Malaysia, especially in the education sector. Seeing how the new data centre is built and managed made me realize the crucial role of Enterprise Architecture (EA) in ensuring good maintain of the organization. I also learned how much effort goes into operating a modern data centre. Overall, the visit helped me to understand the complexity behind digital infrastructure. I would like to have deep research in this topic to learn more about it.

WOO CHENG SHUAN A23CS0283

From this visit, I gained strong motivation and new insights on how innovation in technology can improve human life, especially in the area of digital management and operations. I learned that applying Enterprise Architecture (EA) helps organizations run more smoothly and efficiently compared to traditional methods, even though the transformation process is challenging. Seeing how advanced technologies are used in the data centre showed me how innovation can reduce energy usage and increase reliability. This experience turned the theories from lecture slides into real-life understanding. I believe the knowledge from this visit will be very helpful for my future career.
